

Say 'goodbye' to Specs and Lenses

Accuwave™ Laser eye treatment now offers a safe, affordable alternative to the problems and inconvenience of wearing glasses and contacts.

Laser eye surgery has been a hot topic for many a spectacle wearer for the last 20 years. Most know someone who has had laser eye surgery but many of us still hold some reservations about the process. This could be because we know very little about it, or we find it hard to know which provider to trust. When it comes to our eyesight we need to feel that we are getting a service that is trustworthy and safe. Insight has found one such provider... Accuvision. Accuvision are the leading UK laser eye surgery and eye care specialist. The highly experienced clinical team is led by Mr Chad Rostron, Accuvision's Medical Director and world renowned corneal surgeon. Accuvision's Accuwave™ treatment plans combine highly detailed diagnostics, world leading laser technologies and world leading expertise plus unrivalled levels of customer care at all their clinics, including Accuvision Birmingham, in Solihull.

The Accuvision Accuwave™ treatment plans have helped thousands of spectacle wearers ditch the glasses and experience 20/20 vision or better at a more affordable price compared with other high street clinics.

Jilly Turner states, "It's just over 7 years since I had my vision corrected. No problems, no halos, good night-time vision. Everyone was extremely professional, courteous, patient etc. (I had been for a consultation somewhere else, previously, what a difference...) Not a day goes past that I'm not aware of how wonderful it is to have such good sight after years of wearing thick glasses/ contact lenses. Probably the best money I've ever spent. A big thank you to everyone at Accuvision."

The Consultation & Assessment

Accuvision can treat a wide range of conditions. The first step is a consultation with one of their senior optometrists.

During this free consultation, a series of specialised tests and scans on your eyes are undertaken to assess their condition and compatibility for treatment.

After about an hour of testing and discussion with the senior optometrist about your visual expectations, you will be told what bespoke customised Accuwave treatment plan would be most suitable. At no time are you pressured to undertake any treatment.

Surgery & Aftercare

Lasik eye surgery is the most popular form of laser vision correction. The actual laser eye surgery itself takes between 5 and 30 seconds per eye. As the eyes are anaesthetised you do not feel anything (with the only side effects being slight discomfort, watery eyes and sensitivity to light, yet these do wear off very shortly after). Most patients can return to work and drive 48 hours after surgery.

A bandage contact lens is placed over the eye to protect it after surgery and you are also given eye drops and eye shields to sleep in over night. The following day you return to the clinic to have your bandage contact lenses removed and you are then booked in for a one week check up to monitor progress. Monitoring continues for the year and is included in the Accuwave treatment price.

Trans-Epithelial Surface Treatment

This unique Accuwave™ 'no-touch' procedure enables laser correction, without creating a flap at the front of the cornea. The laser is used twice; first to carefully remove the epithelium from the surface of the treatment zone, leaving it smooth and regular. The second laser treatment alters the shape of the cornea so that sharp vision is achieved. The recovery time can be slightly longer but this Accuwave treatment plan is a particularly good for those that don't want the eye flap surgery, or for those who do high impact sports.
